Shedding Light on Refraction Worksheet

Part A: Refraction

1. What is refraction?

____________________________________________________________________________________
____________________________________________________________________________________
____________________________________________________________________________________

2. (a) **Sketch** the path you would expect the light ray to follow on entering and exiting the glass block.  
   (b) **Draw in the two normal lines** where the light ray strikes each surface.

![Diagram of light ray entering and exiting a glass block with normal lines drawn](image)

3. What is the (approximate) speed of light...
   (a) in a vacuum? ____________________________
   (b) in air? __________________________________
   (c) in water? _______________________________
   (d) in glass? _______________________________

4. Why does refraction occur?

____________________________________________________________________________________
____________________________________________________________________________________
____________________________________________________________________________________

5. Label the following diagram.

![Diagram of light ray entering and exiting a glass block with labels](image)

6. The refracted light ray depicted in Q5 is turning **towards/away from** the normal. (circle the correct answer)

7. Write what the mnemonic FAST stands for.
   - F
   - A
   - S
   - T
Part B: Refractive Index

8. Re-write the expression “n_{bromine} = 1.66” into a sentence.

______________________________________________________________________________________
______________________________________________________________________________________

9. Rewrite the sentence “the refractive index of pyrex equals 1.47” using scientific notation.

______________________________________________________________________________________
______________________________________________________________________________________

10. *refractive index* = \frac{\text{speed of light in vacuum}}{\text{speed of light in substance}}

Calculate the refractive index of the following materials.

<table>
<thead>
<tr>
<th>Substance</th>
<th>Speed of Light in Substance</th>
<th>Refractive Index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polycarbonate</td>
<td>189,900 km/s</td>
<td></td>
</tr>
<tr>
<td>Sapphire</td>
<td>169,500 km/s</td>
<td></td>
</tr>
</tbody>
</table>

11. The higher the refractive index of a material, the ________________ the speed of light within the material.

12. (a) When a light beam passes from a substance with a **high refractive index** to a substance with a **low refractive index** it turns **towards**/away from the normal. (Circle the correct answer.)
(b) Complete the path of the light beam.

13. (a) When a light beam passes from a substance with a **low refractive index** to a substance with a **high refractive index** it turns **towards**/away from the normal. (Circle the correct answer.)
(b) Complete the path of the light beam.

14. (a) Sketch the light rays’ paths as they pass through each material in the following situations.
(b) Draw in the normals. (You will need to work out whether the light ray refracts towards the normal or away from the normal)

i.  

![Diagram](https://via.placeholder.com/150)

\( n_{\text{amber}} = 1.55 \)
\( n_{\text{water}} = 1.33 \)

ii.  

![Diagram](https://via.placeholder.com/150)

\( n_{\text{acetone}} = 1.36 \)
\( n_{\text{diamond}} = 2.42 \)

15. Fill in the table.

<table>
<thead>
<tr>
<th>Angle of Incidence (in air)</th>
<th>Angle of refraction in water ((n_{\text{water}} = 1.33))</th>
<th>Angle of refraction in Perspex ((n_{\text{perspex}} = 1.5))</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>40</td>
<td></td>
<td></td>
</tr>
<tr>
<td>80</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

16. Why does light refract more when it enters perspex than it does when it enters water?

______________________________________________________________________________________
______________________________________________________________________________________
Part C: Refraction and Perception

17. Using text and a ray diagram, explain why the part of the metal bar which is behind the glass appears to be displaced.

18. Explain, using text and a ray diagram, why a person’s legs appear shorter than they really are when they’re standing in the water.

19. When you are using goggles or a face mask underwater, everything appears enlarged. Why?
Part D: Total Internal Reflection

20. In Figure 1, the ray of light shining upwards through the water strikes the undersurface of the water at a small angle of incidence. Some of the light will _________________ as it exits the water, but some will _________________ back into the water.  

21. Onto Figure 1, sketch the two rays formed after the incident ray hits the undersurface of the water.

22. Explain what is happening in the three diagrams above. You must use the expressions “critical angle” and “total internal reflection” (or “totally internally reflects”) in your answer.

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

23. Write two conditions necessary for total internal reflection to occur.
   (a)_____________________________________________________________________________  
   (b)_____________________________________________________________________________  

Part E: Examples of Total Internal Reflection

24. Using text and a diagram, describe why diamonds are so sparkly?

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

25. Using text and a diagram, describe how an optical fibre works?

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________  

_______________________________________________________________________________
