## Graphing Motion: the 100m Sprint.

Name: $\qquad$
Aim: To record information on displacement and time for a sprinter running a 100 m sprint.
Equipment: Stopwatches, trundle wheel, chalk
Method: Set up 10 -metre intervals on a 100 m running track.
When the starter says "go", the timers start timing and the sprinter run towards the finish.
The timers stop their stopwatches when the sprinter runs past them.
Collect data for at least three sprinters. (If a bike is available you might like to collect data for a 100 m bike sprint as well.)

| A | B | C | D | E | F | G | H |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Displacement (m) | Split Times (s) |  |  | Times for each ten-metre interval <br> (s) <br> for Subject $\qquad$ <br> ( 1,2 , or 3 ) |  | Average Velocity during each 10m interval $(\mathrm{m} / \mathrm{s})$ | $\begin{gathered} \text { Mid- } \\ \text { point } \\ \text { Time (s) } \\ \text { (from } \\ \text { column B or } \end{gathered}$ |

| 100 |  |  |  | 90-100m |  |  |  |

Draw

- Displacement vs Time graphs (Column A vs Columns B, C, and D) for your three subjects on one set of axes with displacement on the $\mathbf{y}$-axis and time on the $\mathbf{x}$-axis. Draw a "line-of-best-fit".
- a Velocity vs Time graph (Column G vs Column H) for one of the subjects with velocity on the $y$-axis and time on the $x$-axis. (see the Column $H$ note in the text box.) Draw a line-of-best-fit.
Q1. How far did each subject run in 1 second?
(i)
(ii)
(iii)
$\qquad$
Q2. How far did each subject run in 2 seconds?
(i)
(ii)
(iii)
$\qquad$
Q3. How far did each subject run in 3 seconds?
(i)
(ii)
(iii) $\qquad$
Q4. How much time did it take for each subject to run 35 metres?
(i)
(ii)
(iii)
$\qquad$
(Note: the answers to Qs 5-7 below are not necessarily the same as the answers to Qs 1-3)
Q5. How far did each subject run in the first second?
(i)

$$
x-1
$$

(ii)
(iii) $\qquad$
Q6. How far did each subject run in the second second?
(i)
(ii)
(iii)
$\qquad$
Q7. How far did each subject run in the third second?
(i)
(ii)
(iii)

Q8. What do you notice about the distances in questions 5, 6 and 7?
Q9. How can you judge a runner's velocity from a Displacement vs Time graph?
Q10. How did the runners' velocities change during their sprints?

## Eg. If

10m: 2.36s
20m: 4.24s

## Column F:

Time For Each 10m Interval $=4.24 \mathrm{~s}-$ $2.36 \mathrm{~s}=1.88 \mathrm{~s}$ (it took 1.88 s to run from the 10 m mark to the 20 m mark)

Column G:
Average velocity in each 10 m interval,
$\mathrm{v}=\mathrm{d} / \mathrm{t}$
$\mathrm{v}=10 \mathrm{~m} / 1.88 \mathrm{~s}$
$\mathrm{v}=5.3 \mathrm{~m} / \mathrm{s}$
(the runner's average velocity between the 10 m mark and the 20 m mark was $5.3 \mathrm{~m} / \mathrm{s}$ )

## Column H:

Mid-point time
$=(2.36 \mathrm{~s}+4.24 \mathrm{~s}) / 2=$ 3.3s

The average velocity in each time interval is fairly close to the actual velocity half way in time between the start of the interval and the end of the time interval (the mid-point time). When we draw a velocity vs time graph we will assume that the average velocity of $5.3 \mathrm{~m} / \mathrm{s}$ was the actual (or "instantaneous") velocity at the 3.3 s mark. This is only an approximation, but it's the best we can do with the available data.
